                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Vaccine against infectious polio-virus comprises RNA virus of the producing RNA virus cDNA and viable RNA virus Disclosure, Fig 6; 110pp; English.

The protein sequence was deduced from the cDNA sequence of p3 poliovirus obtd as in Q22965. The cDNA sequence is that of a true RNA virus, i.e. the cDNA directs the prodn. of a viable true RNA virus, hich is phenotypically similar to the source virus. The full length cDNA in pLED3 was infectious. In vitro transcription of pLED3 cDNA using T7 RNA polymerase produced RNAs which possessed several erroneous amino acids. The RNA viruses are used in vaccines against polio. The screening method can be used during amplification of the source virus for vaccine prodn. to ensure maintenance of C at position 2493 in the viral

New cytotoxic T-cell epitope(s) of Epstein Barr virus - useful in sub-unit vaccines to induce cytotoxic T cells

Claim 1; Page 5: 23pp; English:

New cytotoxic T-cell epitopes of Epstein-Barr virus have been isolated and purified (R80017-R80028). Variants of these epitopes have also been identified (R80029-R80033). The epitopes are small, nearlides whose manufacture does not involve use of any

It is used to prepare a vaccine which may include the cytotoxic EBV T-cell epitope (M40828 M40846), or a nucleic acid sequence encoding it. The vaccine produced comprises or encode at least one antigen (M40847-M40876) to which the individual will mount an anamestic response, e.g. a tetanus toxoid, diphtheria toxoid, Bordetella pertussis antigen, poliovirus antigen, purified protein derivative, glycoprotein 350 protein, and/or helper
                                                                                                                                                                                                                                       (CSIR ) COMMONWEALTH SCI & (COUN-) COUNCIL QUEENSLAND (CSLC-) CSL LTD.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Epstein-Barr v
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Compsn. for induction of cytotoxic T cells - comprising CTL epi-
and at least one antigen, in a water in oil formulation
Claim 6; Page 23; 35pp; English.

A water in oil compsn. comprising at least 1 antigen to which an
individual will mount an anamnestic response, and at least one
cytotoxic T cell (CTL) epitope can be used to induce CD8+ CTL
cells in a vaccine, where the CTL epitope is known. The antigen
a diphtheria toxoid, a pertussis or poliovirus antigen, a helpe
epitope or esp. a tetanus toxoid, and the CTL epitope is 1 of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         epitope or esp. a tetanus concerned peptides

PT binding to human CNS 'receptors'.

CC Nucleotides which encode the excitatory amino acid receptors (EAA's) CC can be used for the production of the receptor encoding DNA in CC sequence related genes or for locating the receptors, or their CC sequence. Recombinant cells which produce the receptors, or their CC membrane preparations, can be used for assaying a test ligand for CC binding to a human CNS receptor to develop therapeutics. The CC receptors can themselves be used in the production of antibodies for CC ceptors can themselves be used in the production of an EAA CC receptor's (EAASC) which differs from EAASa described in R50179 CC (the fragment corresponds to amino acid residues 804-840 of EAASa).

Such nucleic acid sequences can be used to detect the stealth virus in medical, veterinary and agricultural diagnostics and in industrial and pharmaceutical biological quality control, e.g. to diagnose a disease associated with the stealth virus. Note: This sequence does not appear in the printed patent specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Elliott
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Stealth virus; chronic fatigue syndrome; CFS; disease; detection; medical diagnostic; veterinary diagnostic; agricultural diagnostic;

This specification describes the amplification of stealth virus fragments from patient D.W. Such fragments can be used as vaccine against chronic fatigue syndrome (CFS). This illness causes unexplained fatigue lasting more than 6 months and greater then 50% reduction in an infected persons normal level of activity. The virus causes a cytopathic effect (CPB) to fibroblast cells observed in culture, characterised by the appearance of rounded, slightly enlarged, refractile cells in the culture.

NOTE: This sequence is given in the Seq ID listing but is not explained in the body of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Unknown.

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. X04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: X04311-X04410; amino acid sequences W78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypucties in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see X04311 for described

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
              PT Helicobacter pylori nucleic acid sequences, and encoded PT Helicobacter pylori nucleic acid sequences, and encoded PT Infection and for diagnosis of H. pylori infection PS Claim [4]; Page 510; 1145pp; English.

CC This sequence is a H. pylori protein of unspecified function. PS Claim [4]; Page 510; 1145pp; English.

CC This sequence is a H. pylori protein of unspecified function. PS Claim [4]; Page 510; 1145pp; English.

CC This sequence is a H. pylori potein of unspecified function. PS Claim [4]; Page 510; 1145pp; English.

CC This sequence is a H. pylori polypeptide binding compounds, or inhibitors. The CC unseful as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life year bylori infection. Nucleic CC acid sequences complementary to the DNA act as antisense sequences and CC against the protein can be used in immunoassays to evaluate the abundance CC against the protein can be used in immunoassays to evaluate the abundance of H. pylori (ATCC 55679) was determined from overlapping contigs generated CC by mechanically shearing the bacterial DNA. The sequences were analysed CC defined by computer evaluation. To identify likely H. pylori antigens for varcoine development, the amino acid sequences predicted from various ORF care analysed for airfifeant homology for other known or exported
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This human secreted protein, designated AK583, is encoded by a full-length cDNA clone (see v02297), deposited in ATCC 98026, that was identified from a database search using an isolated partial AK583 clone, (see v02299). AK583 protein can be used in a claimed method for preventing, treating or ameliorating a medical condition. It may exhibit cytokine, cell proliferation (either inducing or inhibiting) or cell differentiation (either cytokines in certain cell populations. It may also exhibit e.g. immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, receptor/ligand activity, and activities. No evidence of any of these activities is given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 1.4%;

New isolated human genes and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders claim 1; reage 555; 721pp; English.

This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 26 from the human cDNA clone HB6EH18 (deposited as clone ATCC 97898 and ATCC 209044).

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. V9502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V95911-V59812; amino acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                by protein or gene therapy. Also, pathological conditions can be osed by determining the amount of the new polypeptides in a sample determining the presence of mutations in the new polynucleotides. fic uses are described for each of the 186 polynucleotides, based on tissues they are most highly expressed in (see V59511 for described

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H: pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide(s) useful for vaccines to treat or prevent H. infection, and to detect Helicobacter Disclosure; Pages 389; 1481pp; English.
                                                                                                                                                                                                                conditions. Antigenic proteins, peptides and nucleus Malassezia can be used in the diagnosis, prevention of allergic conditions due to Malasse

CC This sequence is a H. pylori cytoplasmic protein involved in CC outer membrane or cell wall biosynthesis.

CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, CC useful as potential H. pylori life cycle activators or inhibitors.

CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, CC and the predicted coding regions defined by computer evaluation. To CI identify likely H. pylori antigens for vaccine development, the amino CC acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest particular regions can be isolated from H: pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

The DGWCC amino acid sequence was deduced from a cDNA clone (see V38294). Also claimed is novel human DNAX Vic-1 (DVIa-1) (see W60649) mature polypeptide, as well as expression vectors and host cells. DGWCC and DVic-1 play a role in the regulation or development of neuronal or haematopoietic cells, e.g. lymphoid cells, which affect immunological responses. They can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. Abnormal proliferation, regeneration,
                                                                                                                                                                                                                                                                 Disclosure; Page 24; 43pp; Japanese.

The sequences given in R38762-79 are peptides which were used to demonstrate the method of the invention. These peptides represent active sites/regions and the method of the invention may be used to predict the active site of a polypeptide by determining the energy values of the secondary structure of various partial regions of the polypeptide to be tested and the primary sequence as well. At least one partial region should show a local peak energy value significantly higher or lower than the average standard energy value. This method may be used in the elucidation of the mechanism of action of polypeptides or polynucleotides, and in the engineered in provement of such sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LT 42

              sites are known

Example 3; Page 28; 75pp; English.

The method for identifying functional sites in proteins was applied to an RNA composed of 359 nucleotides from TRSV. It is known that the catalytically active site exists in the 50 nucleotides between the thymine residues at positions 175 and 224. The nucleotide sequence was translated (the "x"s in the sequence are not defined in the specification). A "discriminant function" was derived from the amino acid sequences of known active sites in a range of other than 1242 and then used to locate the putative position of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RNA was isolated from peripheral lymphocytes and converted to cDNA using a C-beta-specific primer. The cDNA was amplified by anchored PCR using C-beta and polyC primers, then amplified again using a different C-beta specific primer. The amplified product was SacII-restricted, inserted into Bluescript SK+ vector and used to transform E.coli XI-lblue. Transformants were screened with a C-beta specific probe and DNA from positive clones was sequenced in the C-beta region. The sequence designated "IGR b 02" has ca. 85% homology with the sequence HSTCRB33 (see Wilson R.K. et al., Immunogenetics 32:406, 1990) and is a member of the Vbeta w21 subfamily. The peptide encoded by it can be used to block T cell epitopes and in vaccines. See also Q28174-Q28228.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                          secreted proteins, and encode the proteins given in Y12681 to Y13913, or respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, themotactic/
chemokinetic activity, haemostatic and thrombolytic activity, reproductive hormone regulating activity, chemotactic/
cligand activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
